

The Optimal Design of Climate Agreements

Inequality, Trade, and Incentives for Climate Policy

Thomas Bourany

UCHICAGO / COLUMBIA ECON

Society of Economics Dynamics – Copenhagen

June 2025

Motivation

- ▶ Fighting climate change requires implementing ambitious carbon reduction policies

Motivation

- ▶ Fighting climate change requires implementing ambitious carbon reduction policies
 - The **free-riding problem** causes climate inaction
individual countries have no incentives to implement globally optimal policies

Motivation

- ▶ Fighting climate change requires implementing ambitious carbon reduction policies
 - The **free-riding problem** causes climate inaction
individual countries have no incentives to implement globally optimal policies
 - Climate policy has **redistributive effects** across countries:
(i) income differences, (ii) climate damages, (iii) energy markets, (iv) trade leakage

Motivation

- ▶ Fighting climate change requires implementing ambitious carbon reduction policies
 - The **free-riding problem** causes climate inaction
individual countries have no incentives to implement globally optimal policies
 - Climate policy has **redistributive effects** across countries:
(i) income differences, (ii) climate damages, (iii) energy markets, (iv) trade leakage
- ▶ Proposals to fight climate inaction and the free-riding problem:
 - International cooperation through climate agreements, e.g. UN's COP

Motivation

- ▶ Fighting climate change requires implementing ambitious carbon reduction policies
 - The **free-riding problem** causes climate inaction
individual countries have no incentives to implement globally optimal policies
 - Climate policy has **redistributive effects** across countries:
(i) income differences, (ii) climate damages, (iii) energy markets, (iv) trade leakage
- ▶ Proposals to fight climate inaction and the free-riding problem:
 - International cooperation through climate agreements, e.g. UN's COP
 - **Trade sanctions** needed to give incentives to countries to reduce emissions meaningfully
 - “**Climate club**”, Nordhaus (2015): trade sanctions on non-participations to sustain larger “clubs”

Motivation

- ▶ Fighting climate change requires implementing ambitious carbon reduction policies
 - The **free-riding problem** causes climate inaction
individual countries have no incentives to implement globally optimal policies
 - Climate policy has **redistributive effects** across countries:
(i) income differences, (ii) climate damages, (iii) energy markets, (iv) trade leakage
 - ▶ Proposals to fight climate inaction and the free-riding problem:
 - International cooperation through climate agreements, e.g. UN's COP
 - **Trade sanctions** needed to give incentives to countries to reduce emissions meaningfully
 - “**Climate club**”, Nordhaus (2015): trade sanctions on non-participations to sustain larger “clubs”
- ⇒ How can we design a climate agreement, to address **free-riding and endogenous participation** as well as **redistributive effects**, and effectively fight climate change?

Introduction

⇒ What is the optimal climate club, accounting for **free-riding** and **redistributive effects**?

Introduction

⇒ What is the optimal climate club, accounting for **free-riding** and **redistributive effects**?

- The agreement boils down to a choice of countries, a carbon tax, a tariff rate
- Trade-off:
 - Intensive margin*: a “climate club” with few countries and large emission reductions
 - vs. *Extensive margin*: a larger set of countries, at the cost of lowering the carbon tax

Introduction

⇒ What is the optimal climate club, accounting for **free-riding** and **redistributive effects**?

- The agreement boils down to a choice of countries, a carbon tax, a tariff rate
- Trade-off:
Intensive margin: a “climate club” with few countries and large emission reductions
vs. *Extensive margin*: a larger set of countries, at the cost of lowering the carbon tax

► In this paper:

- I build a rich Integrated-Assessment Model (IAM) with heterogeneous countries, energy markets, international trade and countries’ **strategic behaviors**

► Preview of the results:

- **Impossibility result**: Because of free-riding, we cannot achieve **both** a **high carbon tax** and **complete participation**, despite **arbitrary** trade tariffs
- **Optimal club design**: (i) need to **lower the carbon tax** below the Pigouvian benchmark, (ii) impose large trade tariffs and (iii) leave several fossil-fuel producers outside the agreement

6. Main result:
The Optimal Climate Agreement
7. Extensions
8. Conclusion

Model

1. Representative household $\mathcal{U}_i = \max_{c_{ij}} u(\mathcal{D}_i^u(\mathcal{E})c_i)$, Trade, *à la* Armington

$$c_i = \left(\sum_j a_{ij}^{\frac{1}{\theta}} c_{ij}^{\frac{\theta-1}{\theta}} \right)^{\frac{\theta}{\theta-1}} \quad \sum_{j \in \mathbb{I}} c_{ij} \underbrace{(1+t_{ij}^b)}_{\text{tariff}} \underbrace{\tau_{ij}}_{\text{iceberg cost}} p_j = \underbrace{w_i \ell_i}_{\text{labor income}} + \underbrace{\pi_i^f}_{\text{fossil firm profit}} + \underbrace{t_i^{ls}}_{\text{lump-sum transfers}}$$

Model

1. Representative household $\mathcal{U}_i = \max_{c_{ij}} u(\mathcal{D}_i^u(\mathcal{E})c_i)$, Trade, à la Armington

$$c_i = \left(\sum_j a_{ij}^{\frac{1}{\theta}} c_{ij}^{\frac{\theta-1}{\theta}} \right)^{\frac{\theta}{\theta-1}} \quad \sum_{j \in \mathbb{I}} c_{ij} \underbrace{(1+t_{ij}^b)}_{\text{tariff}} \underbrace{\tau_{ij}}_{\text{iceberg cost}} p_j = \underbrace{w_i \ell_i}_{\text{labor income}} + \underbrace{\pi_i^f}_{\text{fossil firm profit}} + \underbrace{t_i^{ls}}_{\text{lump-sum transfers}}$$

2. Representative final good firm:

$$\max_{\ell_i, e_i^f, e_i^c, e_i^r} p_i \mathcal{D}_i^y(\mathcal{E}) z_i F(\ell_i, e_i^f, e_i^c, e_i^r) - w_i \ell_i - (q^f + t_i^\varepsilon) e_i^f - (q_i^c + t_i^\varepsilon) e_i^c - q_i^r e_i^r$$

- Climate externality: $\mathcal{D}_i^y(\mathcal{E})$, Income inequality z_i , Carbon tax: t_i^ε

Model

1. Representative household $\mathcal{U}_i = \max_{c_{ij}} u(\mathcal{D}_i^u(\mathcal{E})c_i)$, Trade, à la Armington

$$c_i = \left(\sum_j a_{ij}^{\frac{1}{\theta}} c_{ij}^{\frac{\theta-1}{\theta}} \right)^{\frac{\theta}{\theta-1}} \quad \sum_{j \in \mathbb{I}} c_{ij} \underbrace{(1+t_{ij}^b)}_{\text{tariff}} \underbrace{\tau_{ij}}_{\text{iceberg cost}} p_j = \underbrace{w_i \ell_i}_{\text{labor income}} + \underbrace{\pi_i^f}_{\text{fossil firm profit}} + \underbrace{t_i^{ls}}_{\text{lump-sum transfers}}$$

2. Representative final good firm:

$$\max_{\ell_i, e_i^f, e_i^c, e_i^r} p_i \mathcal{D}_i^y(\mathcal{E}) z_i F(\ell_i, e_i^f, e_i^c, e_i^r) - w_i \ell_i - (q^f + t_i^\varepsilon) e_i^f - (q_i^c + t_i^\varepsilon) e_i^c - q_i^r e_i^r$$

- Climate externality: $\mathcal{D}_i^y(\mathcal{E})$, Income inequality z_i , Carbon tax: t_i^ε

3. Energy markets

- Fossil-fuels (oil-gas) producer, extracting e_i^x , selling on international market, at price q^f :

$$\pi_i^f = \max_{e_i^x} q^f e_i^x - \mathcal{C}_i^f(e_i^x) \mathbb{P}_i \quad E^f = \sum_{i \in \mathbb{I}} e_i^f = \sum_{i \in \mathbb{I}} e_i^x$$

Model

1. Representative household $\mathcal{U}_i = \max_{c_{ij}} u(\mathcal{D}_i^u(\mathcal{E})c_i)$, Trade, à la Armington

$$c_i = \left(\sum_j a_{ij}^{\frac{1}{\theta}} c_{ij}^{\frac{\theta-1}{\theta}} \right)^{\frac{\theta}{\theta-1}} \quad \sum_{j \in \mathbb{I}} c_{ij} \underbrace{(1+t_{ij}^b)}_{\text{tariff}} \underbrace{\tau_{ij}}_{\text{iceberg cost}} p_j = \underbrace{w_i \ell_i}_{\text{labor income}} + \underbrace{\pi_i^f}_{\text{fossil firm profit}} + \underbrace{t_i^{ls}}_{\text{lump-sum transfers}}$$

2. Representative final good firm:

$$\max_{\ell_i, e_i^f, e_i^c, e_i^r} p_i \mathcal{D}_i^y(\mathcal{E}) z_i F(\ell_i, e_i^f, e_i^c, e_i^r) - w_i \ell_i - (q^f + t_i^\varepsilon) e_i^f - (q_i^c + t_i^\varepsilon) e_i^c - q_i^r e_i^r$$

- Climate externality: $\mathcal{D}_i^y(\mathcal{E})$, Income inequality z_i , Carbon tax: t_i^ε

3. Energy markets

- Fossil-fuels (oil-gas) producer, extracting e_i^x , selling on international market, at price q^f :

$$\pi_i^f = \max_{e_i^x} q^f e_i^x - \mathcal{C}_i^f(e_i^x) \mathbb{P}_i \quad E^f = \sum_{i \in \mathbb{I}} e_i^f = \sum_{i \in \mathbb{I}} e_i^x$$

- Coal e_i^c produced at price $q_i^c = z_i^c \mathbb{P}_i$ ◦ Renewables e_i^r produced at price $q_i^r = z_i^r \mathbb{P}_i$

Outline

2. Model:
An Integrated Assessment Model with Heterogenous Countries and Trade
3. **Climate Agreements Design**
4. Quantification
5. Policy Benchmarks:
Optimal Policy without Free-riding Incentives
6. Main result:
The Optimal Climate Agreement
7. Extensions
8. Conclusion

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^{\varepsilon}, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^{\varepsilon} = t^{\varepsilon}$

Climate agreement design: “rules of the game”

- ▶ **Definition:** A climate agreement is a set $\{\mathbb{J}, t^{\varepsilon}, t^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
 - Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^{\varepsilon} = t^{\varepsilon}$
 - Single **uniform carbon tax**. Corresponds to the Pigouvian (First-Best) benchmark

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^e, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^e = t^e$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = t^b$ on goods from j

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, t^{\varepsilon}, t^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^{\varepsilon} = t^{\varepsilon}$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = t^b$ on goods from j
 - Single uniform tariff on goods. **Extension** considering carbon-tariffs (\sim CBAM)

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^e, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^e = \mathbf{t}^e$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^{\varepsilon}, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^{\varepsilon} = \mathbf{t}^{\varepsilon}$
 - If j **exits the agreement**, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - Provides “issue linkage” between the **trade** and **climate** policies

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^e, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^e = \mathbf{t}^e$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^\varepsilon = \mathbf{t}^\varepsilon$
 - If j **exits the agreement**, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Assumption relaxed in an **extension**: oil-gas-specific tariffs

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^e, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^e = \mathbf{t}^e$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Local, lump-sum rebate of taxes: $t_i^{ls} = \mathbf{t}^e(e_i^f + e_i^c) + \sum_{j \notin \mathbb{J}} \mathbf{t}^b \tau_{ij} c_{ij} p_j$

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, t^\varepsilon, t^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^\varepsilon = t^\varepsilon$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = t^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Local, lump-sum rebate of taxes: $t_i^{ls} = t^\varepsilon(e_i^f + e_i^c) + \sum_{j \notin \mathbb{J}} t^b \tau_{ij} c_{ij} p_j$
 - No cross-countries transfers allowed. Assumption relaxed in an **extension**: “climate fund”

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^e, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $\mathbf{t}_i^e = \mathbf{t}^e$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $\mathbf{t}_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $\mathbf{t}_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Local, lump-sum rebate of taxes: $\mathbf{t}_i^{ls} = \mathbf{t}^e(e_i^f + e_i^c) + \sum_{j \notin \mathbb{J}} \mathbf{t}_{ij}^b \tau_{ij} c_{ij} p_j$
 - Countries outside the club $k \notin \mathbb{J}$ have passive policies, $\mathbf{t}_{ki}^b = 0$ and $\mathbf{t}_k^e = 0$.

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, t^\varepsilon, t^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^\varepsilon = t^\varepsilon$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = t^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Local, lump-sum rebate of taxes: $t_i^{ls} = t^\varepsilon(e_i^f + e_i^c) + \sum_{j \notin \mathbb{J}} t^b \tau_{ij} c_{ij} p_j$
 - Countries outside the club $k \notin \mathbb{J}$ have passive policies, $t_{ki}^b = 0$ and $t_k^\varepsilon = 0$.
 - No retaliation. Assumption relaxed in an extension: coordination to retaliate and trade wars

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $t_i^\varepsilon = t^\varepsilon$
 - If j exits the agreement, club members $i \in \mathbb{J}$ impose uniform tariffs $t_{ij}^b = t^b$ on goods from j
 - Countries in the club benefit from free-trade $t_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Local, lump-sum rebate of taxes: $t_i^{ls} = t^\varepsilon(e_i^f + e_i^c) + \sum_{j \notin \mathbb{J}} t^b \tau_{ij} c_{ij} p_j$
 - Countries outside the club $k \notin \mathbb{J}$ have passive policies, $t_{ki}^b = 0$ and $t_k^\varepsilon = 0$.
 - Indirect utility $\mathcal{U}_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \equiv u(\mathcal{D}_i^y(\mathcal{E}(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b)) c_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b))$

Climate agreement design: “rules of the game”

- **Definition:** A climate agreement is a set $\{\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b\}$ of $\mathbb{J} \subseteq \mathbb{I}$ countries and a C.E. s.t.:
- Countries $i \in \mathbb{J}$ pay carbon tax: $\mathbf{t}_i^\varepsilon = \mathbf{t}^\varepsilon$
 - If j **exits the agreement**, club members $i \in \mathbb{J}$ impose uniform tariffs $\mathbf{t}_{ij}^b = \mathbf{t}^b$ on goods from j
 - Countries in the club benefit from free-trade $\mathbf{t}_{ij}^b = 0$ (or “status-quo” policy).
 - All countries trade in oil-gas at price q^f
 - Local, lump-sum rebate of taxes: $\mathbf{t}_i^{ls} = \mathbf{t}^\varepsilon(e_i^f + e_i^c) + \sum_{j \notin \mathbb{J}} \mathbf{t}_{ij}^b \tau_{ij} c_{ij} p_j$
 - Countries outside the club $k \notin \mathbb{J}$ have **passive policies**, $\mathbf{t}_{ki}^b = 0$ and $\mathbf{t}_k^\varepsilon = 0$.
 - Indirect utility $\mathcal{U}_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \equiv u(\mathcal{D}_i^y(\mathcal{E}(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b)) c_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b))$
- **Equilibrium concepts:**
- Unilateral participation decision of i , $\mathbb{J} \setminus \{i\}$, \Rightarrow **Nash equilibrium**
- Coalition \mathbb{J} stable if
$$\mathcal{U}_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \geq \mathcal{U}_i(\mathbb{J} \setminus \{i\}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \quad \forall i \in \mathbb{J}$$
- Sub-coalitional deviation \Rightarrow **Coalitional Nash equilibrium**

Optimal design with endogenous participation

- Objective: search for the optimal *and stable* climate agreement

$$\begin{aligned} \max_{\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b} \mathcal{W}(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b) &= \max_{\mathbf{t}^\varepsilon, \mathbf{t}^b} \max_{\mathbb{J}} \sum_{i \in \mathbb{I}} \omega_i \mathcal{U}_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \\ \text{s.t.} \quad &\mathcal{U}_i(\mathbb{J}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \geq \mathcal{U}_i(\mathbb{J} \setminus \{i\}, \mathbf{t}^\varepsilon, \mathbf{t}^b) \end{aligned}$$

- Current design:

(i) choose taxes $\{\mathbf{t}^\varepsilon, \mathbf{t}^b\}$ [outer problem]

(ii) choose the coalition \mathbb{J} s.t. participation constraints hold [inner problem]

⇒ *Combinatorial Discrete Choice Problem* for $\mathbb{J} \in \mathcal{P}(\mathbb{I})$

- Solution method: use a “squeezing procedure”, as in Jia (2008), Arkolakis, Eckert, Shi (2023) extended to handle participation constraints, Approach, details, Deviations, Solution methods

Optimal Policy without Free-riding Incentives
6. Main result:
The Optimal Climate Agreement
7. Extensions
8. Conclusion

Optimal policy benchmarks

- ▶ Policy benchmarks, without free-riding incentives
 - ***First-Best***, Social planner maximizing global welfare with unlimited instruments
 - Pigouvian result: Carbon tax = Social Cost of Carbon
 - Relies heavily on cross-country transfers to offset redistributive effects

Optimal policy benchmarks

► Policy benchmarks, without free-riding incentives

- **First-Best**, Social planner maximizing global welfare with unlimited instruments
 - Pigouvian result: Carbon tax = Social Cost of Carbon
 - Relies heavily on cross-country transfers to offset redistributive effects
- **Second-Best**: Social planner, single carbon tax without transfers
 - Optimal carbon tax t^E correct climate externality, but also accounts for:
 - (i) Redistribution motives, and G.E. effects on (ii) energy markets and (iii) trade leakage

$$t^E = \underbrace{\sum_i \phi_i LCC_i}_{=SCC} + \sum_i \phi_i \text{Supply Redistrib}_i^o + \sum_i \phi_i \text{Demand Distort}_i^o - \sum_i \text{Trade Redistrib}_i^o \quad \phi_i \propto \omega_i u'(c_i)$$

- Details: **CE**, **First-Best**, **Second-Best**, **Club policy**
- Companion paper: Bourany (2024), *Climate Change, Inequality, and Optimal Climate Policy*
- **Unilateral policy**: local planners choose their own optimal climate-trade policy,
see Farrokhi, Laksharipour (2024), Kortum, Weisbach (2022) **Nash-Unilateral Policies**

Second-Best climate policy

- Accounting for redistribution and lack of transfers
- ⇒ implies a carbon tax lower than the Social Cost of Carbon (SCC), from \$155 to \$131/ tCO_2 .

Gains from cooperation – World Optimal policy

- ▶ Optimal carbon tax
Second Best: $\sim \$131/tCO_2$
- ▶ Reduce fossil fuels / CO_2 emissions by 45% compared to the Competitive equilibrium (Business as Usual, BAU)
- ▶ Welfare difference between world optimal policy vs. comp. eq./BAU

Outline

1. Introduction

An Integrated Assessment Model with Heterogenous Countries and Trade
3. Climate Agreements Design
4. Quantification
5. Policy Benchmarks:
Optimal Policy without Free-riding Incentives
6. **Main result:**
The Optimal Climate Agreement
7. Extensions
8. Conclusion

Main result and Intuition

- ▶ The optimal climate agreement navigates the **intensive** and **extensive** margin tradeoff:
 - **Participation:** all the countries in the world with the exception of Russia, former Soviet countries, Saudi Arabia, Iran, Nigeria
 - **Carbon tax:** need to reduce tax level from \$131 to \$114/ tCO_2
 - **Trade tariffs:** impose substantial tariff 50% on the goods from non-members

Main result and Intuition

- ▶ The optimal climate agreement navigates the **intensive** and **extensive** margin tradeoff:
 - **Participation:** all the countries in the world with the exception of Russia, former Soviet countries, Saudi Arabia, Iran, Nigeria
 - **Carbon tax:** need to reduce tax level from \$131 to \$114/ tCO_2
 - **Trade tariffs:** impose substantial tariff 50% on the goods from non-members
 - ▶ **Mechanism:**
 - Countries participate depending on $\left\{ \begin{array}{l} \text{(i) the cost of distortionary carbon taxation} \\ \text{(ii) the cost of tariffs (= the gains from trade)} \end{array} \right.$
 - Russia/Middle East/South Asia do not join the club for high carbon tax *for any tariffs*, because cost of taxing fossil-fuels \gg cost of tariffs / autarky
- ⇒ As a result, we need to decrease the carbon tax

Laffer curve for carbon taxation

- Due to free-riding incentives, **cannot reach** globally optimal carbon tax $t^{\epsilon,*} = \$131$

Emissions \mathcal{E} (in $GtCO_2/yr$) and welfare \mathcal{W} as function of the carbon tax t^{ϵ} , with tariff $t^b = 50\%$.

Laffer curve for carbon taxation

- Due to free-riding incentives, **cannot reach** globally optimal carbon tax $t^{\varepsilon,*} = \$131$
- Need to lower the carbon tax to **increase participation**:
Improve welfare by sharing the costs of carbon mitigation with *more countries*

Emissions \mathcal{E} (in $GtCO_2/yr$) and welfare \mathcal{W} as function of the carbon tax t^{ε} , with tariff $t^b = 50\%$.

Climate Agreements: Intensive vs. Extensive Margin

► Intensive margin:

given a coalition:

higher tax $t^{\mathcal{E}}$, emissions $\mathcal{E} \downarrow$,
improve welfare $\mathcal{W} \uparrow$

► Extensive margin:

carbon tax also deters
participation
individual countries free-ride
increasing emissions $\mathcal{E} \uparrow$

Optimal Climate Agreement

► Despite full discretion of instruments (t^e, t^b), we cannot sustain an agreement with Russia, Middle East, South-Asia & South America

⇒ need to **reduce carbon tax** from \$131 to \$114

⇒ Beneficial to **leave several fossil-fuel producers outside the agreement**
e.g. no incentive for Russia to join: cold, closed to trade, large fossil-fuel producer

Graph welfare

Emission reduction vs. Welfare: Different metrics!

- Agreements with tariffs recover 92% of welfare gains from the Second-Best – optimal carbon tax without transfers – at a cost of increasing emissions by 11%
- Setting the policy “wrongly” at $t^E = SCC = \$155$ lowers the participation: India, Pakistan, Egypt, Turkey, Argentina, Brazil, Rest of Middle-East, **all exit the agreement**

Outline

1. Introduction
2. Model:
An Integrated Assessment Model with Heterogenous Countries and Trade
3. Climate Agreements Design
4. Quantification
5. Policy Benchmarks:
Optimal Policy without Free-riding Incentives
6. Main result:
The Optimal Climate Agreement
7. **Extensions**
8. Conclusion

Extensions

1. Coalition building [details](#)
 - Sequential procedure: Europe as first mover, then US & Asia, then developing countries
2. Transfers – Climate fund, c.f. COP29's proposal, [details](#)
 - Optimal size: zero! Advanced economies lose from lump-sum transfers to developing countries
3. Carbon Border Adjustment Mechanism (CBAM), c.f. EU policy [details](#)
 - Still need a very high carbon tariff to incentivize participation
4. Fossil-fuels specific tariffs \sim price cap on oil-gas exports, [details](#)
 - Target energy rent of fossil-fuel producers:
can induce their participation but can not increase the optimal carbon tax t^E
5. Retaliation – Trade war between club and non-club members, [details](#)
 - Moderate retaliation induce a lower carbon tax, Large “trade war” induces “mutual destruction” and can promote cooperation

Conclusion

- ▶ In this project, I solve for the optimal design of climate agreements
 - Accounting for *free-riding incentives*, as well as for inequality, GE effects through energy markets and trade leakage
- ▶ Climate agreement design jointly solves for:
 - The optimal choice of countries participating
 - The carbon tax and tariff levels, accounting for participation constraints
- ▶ The optimal climate club depends on the trade-off between:
 - the gains from climate cooperation and free-riding incentives
 - the gains from trade, i.e. the cost of retaliatory tariffs

⇒ Need a large coalition at a cost of lowering the carbon tax from the world optimum \$130 to \$110
- ▶ Future research:
 - Dynamic policy games, bargaining, and coalition building

Conclusion

Thank you!

thomasbourany@uchicago.edu

Appendices

Optimal design with endogenous participation

- ▶ Why uniform policy instruments t^e and t^b for all club members:
 - Our social planner/designer solution represents the outcome of a “bargaining process” between countries (with bargaining weights ω_i).
 - Deviation from Coase theorem:
 - With transaction/bargaining cost: impossible to reach a consensual decision on $I + I \times I$ instruments $\{t_i^e, t_{ij}^b\}_{ij}$
 - Such costs increase exponentially in the number of countries I

Optimal design with endogenous participation

- ▶ Why uniform policy instruments t^ε and t^b for all club members:
 - Our social planner/designer solution represents the outcome of a “bargaining process” between countries (with bargaining weights ω_i).
 - Deviation from Coase theorem:
 - With transaction/bargaining cost: impossible to reach a consensual decision on $I + I \times I$ instruments $\{t_i^\varepsilon, t_{ij}^b\}_{ij}$
 - Such costs increase exponentially in the number of countries I
- ▶ Optimal – country specific – carbon taxes:
 - Without free-riding / exogeneous participation

$$t_i^\varepsilon = \frac{1}{\phi_i} t^\varepsilon \propto \frac{1}{\omega_i u'(c_i)} [SCC + SCF - SCT]$$

- With participation constraints: multiplier $\nu_i(\mathbb{J})$

$$t_i^\varepsilon \propto \frac{1}{(\omega_i + \nu_i(\mathbb{J})) u'(c_i)} [SCC + SCF - SCT]$$

Optimal design with endogenous participation

► Equilibrium concepts and participation constraints:

- **Nash equilibrium** \Rightarrow unilateral deviation $\mathbb{J} \setminus \{j\}$, $\mathbb{J} \in \mathbb{S}(t^f, t^b)$ if:

$$\mathcal{U}_i(\mathbb{J}, t^e, t^b) \geq \mathcal{U}_i(\mathbb{J} \setminus \{i\}, t^e, t^b) \quad \forall i \in \mathbb{J}$$

- **Coalitional Nash-equilibrium** $\mathbb{C}(t^f, t^b)$: robust of sub-coalitions deviations:

$$\mathcal{U}_i(\mathbb{J}, t^f, t^b) \geq \mathcal{U}_i(\mathbb{J} \setminus \hat{\mathbb{J}}, t^f, t^b) \quad \forall i \in \hat{\mathbb{J}} \text{ \& \& } \forall \hat{\mathbb{J}} \subseteq \mathbb{J} \cup \{i\}$$

- Stability requires to check all potential coalitions $\mathbb{J} \in \mathcal{P}(\mathbb{I})$ as all sub-coalitions $\mathbb{J} \setminus \hat{\mathbb{J}}$ are considered as deviations in the equilibrium
- Requires to solve all the combination \mathbb{J}, t^f, t^b , by exhaustive enumeration.
 \Rightarrow becomes very computationally costly for $I = \#(\mathbb{I}) > 10$

back

Climate club design:

- Separation of the joint problem into inner and outer problems, s.t. participation constraints

$$\begin{aligned} \max_{\mathbb{J}, t^e, t^b} \mathcal{W}(\mathbb{J}, t^e, t^b) &= \max_{t^e, t^b} \max_{\mathbb{J}} \sum_{i \in \mathbb{I}} \omega_i \mathcal{U}_i(\mathbb{J}, t^e, t^b) = \max_{\mathbb{J}} \max_{t^e, t^b} \sum_{i \in \mathbb{I}} \omega_i \mathcal{U}_i(\mathbb{J}, t^e, t^b) \\ \text{s.t.} \quad &\mathcal{U}_i(\mathbb{J}, t^e, t^b) \geq \mathcal{U}_i(\mathbb{J} \setminus \{i\}, t^e, t^b) \end{aligned}$$

- Current design:

- (i) choose taxes $\{t^e, t^b\}$ [outer problem]
- (ii) choose the coalition \mathbb{J} s.t. participation constraints hold [inner problem]

► Computation:

M policies (grid search), 2^N choices of coalition (include both unilateral and subcoalition dev.)

- Alternative

- (i) choose the coalition \mathbb{J} [outer problem]
- (ii) choose taxes $\{t^e, t^b\}$ [inner problem]
- (iii) check participation constraints for (\mathbb{J}, t^e, t^b)

► Computation: 2^N choices of coalition, M policies (grid search?), N unilateral deviations

back

Country deviation and policy

- ▶ Consider coalition \mathbb{J} . Suppose we search for optimal policy $\mathbf{t}^{\varepsilon}(\mathbb{J}), \mathbf{t}^b(\mathbb{J})$
 - Requires to compute allocation $\mathcal{U}_i(\mathbb{J}, \mathbf{t}^{\varepsilon}(\mathbb{J}), \mathbf{t}^b(\mathbb{J}))$
 - Participation constraints $\mathcal{U}_i(\mathbb{J}, \mathbf{t}^{\varepsilon}(\mathbb{J}), \mathbf{t}^b(\mathbb{J})) \geq \mathcal{U}_i(\mathbb{J} \setminus \{i\}, \mathbf{t}^{\varepsilon}(\mathbb{J} \setminus \{i\}), \mathbf{t}^b(\mathbb{J} \setminus \{i\}))$ with multiplier $\nu_{\mathbb{J},i}$
 - Requires to compute allocation $\mathcal{U}_i(\mathbb{J} \setminus \{i\}, \mathbf{t}^{\varepsilon}(\mathbb{J} \setminus \{i\}), \mathbf{t}^b(\mathbb{J} \setminus \{i\}))$
 - Participation constraints $\mathcal{U}_j(\mathbb{J} \setminus \{i\}, \mathbf{t}^{\varepsilon}(\mathbb{J} \setminus \{i\}), \mathbf{t}^b(\mathbb{J} \setminus \{i\})) \geq \mathcal{U}_j(\mathbb{J} \setminus \{i, j\}, \mathbf{t}^{\varepsilon}(\mathbb{J} \setminus \{i, j\}), \mathbf{t}^b(\mathbb{J} \setminus \{i, j\}))$ with multiplier $\nu_{\mathbb{J} \setminus \{i\},j}$
 - Etc etc.
- ▶ Implies that we would need to solve *jointly* for $2^{\mathbb{J}}$ allocations and policy for coalitions \mathbb{J} , and each of them with $2^{\mathbb{J}}$ constraints and multipliers \Rightarrow untractable

back

Solution method

- ▶ Current design: $\max_{\mathbf{t}} \max_{\mathbb{J}} \mathcal{W}(\mathbb{J}, \mathbf{t}) \text{ s.t. } \mathcal{U}_j(\mathcal{J}, \mathbf{t}) \geq \mathcal{U}_j(\mathcal{J} \setminus \{i\}, \mathbf{t})$
- ▶ Inner problem: CDCP Solution method
 - Use a “squeezing procedure”, as in Jia (2008), Arkolakis, Eckert, Shi (2023) extended to handle participation constraints

Solution method

- ▶ Current design: $\max_{\mathbf{t}} \max_{\mathbb{J}} \mathcal{W}(\mathbb{J}, \mathbf{t})$ s.t. $\mathcal{U}_j(\mathcal{J}, \mathbf{t}) \geq \mathcal{U}_j(\mathcal{J} \setminus \{i\}, \mathbf{t})$
- ▶ Inner problem: CDCP Solution method
 - Use a “squeezing procedure”, as in Jia (2008), Arkolakis, Eckert, Shi (2023) extended to handle participation constraints
 - Squeezing step:

$$\Phi(\mathcal{J}) \equiv \{j \in \mathbb{I} \mid \Delta_j \mathcal{W}(\mathcal{J}) > 0 \text{ \& } \Delta_j \mathcal{U}_j(\mathcal{J}, \mathbf{t}) > 0, \forall j \in \mathcal{J}\}$$

where marginal values of $j \in \mathcal{J}$ for global $\Delta_j \mathcal{W}(\mathcal{J}, \mathbf{t})$ and individual welfare $\Delta_j \mathcal{U}_j(\mathcal{J}, \mathbf{t})$ are:

$$\Delta_j \mathcal{W}(\mathcal{J}, \mathbf{t}) \equiv \mathcal{W}(\mathcal{J} \cup \{j\}, \mathbf{t}) - \mathcal{W}(\mathcal{J} \setminus \{j\}, \mathbf{t}) \qquad \Delta_j \mathcal{U}_j(\mathcal{J}, \mathbf{t}) \equiv \mathcal{U}_j(\mathcal{J} \cup \{j\}, \mathbf{t}) - \mathcal{U}_j(\mathcal{J} \setminus \{j\}, \mathbf{t})$$

Solution method

- ▶ Current design: $\max_{\mathbf{t}} \max_{\mathbb{J}} \mathcal{W}(\mathbb{J}, \mathbf{t})$ s.t. $\mathcal{U}_j(\mathcal{J}, \mathbf{t}) \geq \mathcal{U}_j(\mathcal{J} \setminus \{i\}, \mathbf{t})$
- ▶ Inner problem: CDCP Solution method
 - Use a “squeezing procedure”, as in Jia (2008), Arkolakis, Eckert, Shi (2023) extended to handle participation constraints
 - Squeezing step:

$$\Phi(\mathcal{J}) \equiv \{j \in \mathbb{I} \mid \Delta_j \mathcal{W}(\mathcal{J}) > 0 \text{ \& } \Delta_j \mathcal{U}_j(\mathcal{J}, \mathbf{t}) > 0, \forall j \in \mathcal{J}\}$$

where marginal values of $j \in \mathcal{J}$ for global $\Delta_j \mathcal{W}(\mathcal{J}, \mathbf{t})$ and individual welfare $\Delta_j \mathcal{U}_j(\mathcal{J}, \mathbf{t})$ are:

$$\Delta_j \mathcal{W}(\mathcal{J}, \mathbf{t}) \equiv \mathcal{W}(\mathcal{J} \cup \{j\}, \mathbf{t}) - \mathcal{W}(\mathcal{J} \setminus \{j\}, \mathbf{t}) \quad \Delta_j \mathcal{U}_j(\mathcal{J}, \mathbf{t}) \equiv \mathcal{U}_j(\mathcal{J} \cup \{j\}, \mathbf{t}) - \mathcal{U}_j(\mathcal{J} \setminus \{j\}, \mathbf{t})$$

- Iterative procedure build lower bound $\underline{\mathcal{J}}$ and upper bound $\overline{\mathcal{J}}$ by successive squeezing steps

$$\underline{\mathcal{J}}^{(k+1)} = \Phi(\underline{\mathcal{J}}^{(k)}) \quad \overline{\mathcal{J}}^{(k+1)} = \Phi(\overline{\mathcal{J}}^{(k)})$$

- Squeezing procedure converges to the optimal set under *Complementarity* Assumption, Details

[Back, solution method](#)

Complementarity

- Application of *Squeezing procedure* as in Arkolakis, Eckert, Shi (2023)
- Condition: Single Crossing Differences in choice (SCD-C),
that I extend to account for participation constraints (SCD-C,PC)
- In our setting, condition as follows:

IF the coalition \mathcal{J} makes (i) allocation outcomes better for welfare with $\{j\}$, if both \mathcal{J} and $\mathcal{J} \cup \{j\}$ are stable, or (ii) the coalition $\mathcal{J} \cup \{j\}$ is stable if \mathcal{J} is unstable

THEN one of these conditions should also be respected for larger coalitions $\mathcal{J}' \supseteq \mathcal{J}$.

$$\left\{ \begin{array}{l} \Delta_i \mathcal{U}_i(\mathcal{J} \cup \{j\}) \geq 0 \\ \& \left[\begin{array}{l} \left(\Delta_j \mathcal{W}(\mathcal{J} \cup \{j\}) \geq 0 \& \Delta_i \mathcal{U}_i(\mathcal{J}) \geq 0 \right) \\ \text{or } \Delta_i \mathcal{U}_i(\mathcal{J}) < 0 \end{array} \right] \end{array} \right. \Rightarrow \left\{ \begin{array}{l} \Delta_i \mathcal{U}_i(\mathcal{J}' \cup \{j\}) \geq 0 \\ \& \left[\begin{array}{l} \left(\Delta_j \mathcal{W}(\mathcal{J}' \cup \{j\}) \geq 0 \& \Delta_i \mathcal{U}_i(\mathcal{J}') \geq 0 \right) \\ \text{or } \Delta_i \mathcal{U}_i(\mathcal{J}') < 0 \end{array} \right] \end{array} \right.$$

$\forall \mathcal{J} \subseteq \mathcal{J}' \quad \forall j \in \mathbb{I} \quad (\text{SCD-C, PC})$

Welfare and Pareto weights

- Welfare:

$$\mathcal{W}(\mathbb{J}) = \sum_{i \in \mathbb{I}} \omega_i u(c_i)$$

- Pareto weights ω_i :

$$\omega_i = \frac{1}{u'(\bar{c}_i)}$$

for \bar{c}_i consumption in initial equilibrium
“without climate change“, i.e. year = 2020

- Imply no redistribution motive in $t = 2020$

$$\omega_i u'(\bar{c}_i) = \omega_j u'(\bar{c}_j) \quad \forall i, j \in \mathbb{I}$$

- Climate change, taxation, and climate agreement (tax + tariffs) have redistributive effects
 \Rightarrow change distribution of c_i

Pareto weights - Negishi

back

Quantification – Trade model

- Armington Trade model:

$$s_{ij} \equiv \frac{c_{ij}p_{ij}}{c_i p_i} = a_{ij} \frac{((1+t_{ij})\tau_{ij}p_j)^{1-\theta}}{\sum_k a_{ik}((1+t_{ik})\tau_{ik}p_k)^{1-\theta}}$$

- Estimated gravity equation regression:

$$\log(s_{ij}) = f_i + f_j + \underbrace{\beta(1-\theta)}_{=\kappa} \log d_{ij}$$

- Get $\kappa = -1.43$, CES $\theta = 5$ minimizing variance of a_{ij}
- Iceberg cost τ_{ij} as projection of distance
 $\log \tau_{ij} = \beta \log d_{ij}$
- Preferences a_{ij} captures the remaining variation in trade shares s_{ij} , i.e. $a_{ij} \propto (1+t_{ij})\bar{\tau}_{ij}\bar{a}_{ij}$
 \Rightarrow invariant to the club policies

back

Step 0: Competitive equilibrium & Trade

- ▶ Each household in country i maximize utility and firms maximize profit
- ▶ Standard trade model results:
 - Consumption and trade:

$$s_{ij} = \frac{c_{ij}p_{ij}}{c_i p_i} = a_{ij} \frac{(\tau_{ij}(1+t_{ij}^b)p_j)^{1-\theta}}{\sum_k a_{ik}(\tau_{ik}(1+t_{ik}^b)p_k)^{1-\theta}} \quad \& \quad p_i = \left(\sum_j a_{ij}(\tau_{ij}p_j)^{1-\theta} \right)^{\frac{1}{1-\theta}}$$

- Energy consumption doesn't internalize climate damage:

$$p_i MPe_i = q^e$$

- Inequality, as measured in local welfare units:

$$\lambda_i = u'(c_i)$$

- “Local Social Cost of Carbon”, for region i

$$LCC_i = -\frac{\partial \mathcal{W}_i / \partial \mathcal{E}}{\partial \mathcal{W}_i / \partial c_i} = \frac{\psi_i^{\mathcal{E}}}{\lambda_i} \rightarrow \frac{\Delta_i \chi}{\rho - n + (1 - \eta)\bar{g}} (T_i - T_i^*) [\gamma^y p_i y_i + \gamma^u c_i p_i] \quad (> 0 \text{ for warm regions})$$

Step 1: World First-best policy

- Maximizing welfare of the world Social Planner:

$$\mathcal{W} = \max_{\{\mathbf{t}, \mathbf{e}, \mathbf{q}\}_i} \sum_{i \in \mathbb{I}} \omega_i u(c_i) = \sum_{\mathbb{I}} \mathcal{W}_i$$

- Full array of instruments: cross-countries lump-sum transfers \mathbf{t}_i^{ls} , unrestricted individual carbon taxes \mathbf{t}_i^e on energy e_i^f, e_i^c , unrestricted bilateral tariffs \mathbf{t}_{ij}^b
 - Budget constraint: $\sum_i \mathbf{t}_i^{ls} = \sum_i \mathbf{t}_i^f e_i^f + \sum_{i,j} \mathbf{t}_{ij}^b c_{ij} \tau_{ij} p_j$
- Maximize welfare subject to
- Market clearing for good i , $[\mu_i]$, market clearing for energy μ^e

back

Step 1: World First-best policy

► Social planner allocation and decentralization:

- Consumption:

$$\omega_i u'(c_i) = \bar{\lambda} \left[\sum_j a_{ij} (\tau_{ij} \omega_j \mu_j)^{1-\theta} \right]^{\frac{1}{1-\theta}} = \bar{\lambda} \mathbb{P}_i \qquad \omega_i \frac{u'(c_i)}{\mathbb{P}_i} = \bar{\lambda}$$

- Energy use:

$$\omega_i \mu_i M P e_i = \mu^e + SCC$$

- Social cost of carbon:

$$SCC \rightarrow \sum_j \omega_j \frac{\Delta_j \chi}{\rho - n + (1-\eta)\bar{g}} (T_j - T_j^*) [\gamma^y \mu_j y_j + \gamma^u c_j \mathbb{P}_j]$$

- Decentralization:

large transfers to equalize marg. utility + carbon tax = SCC

$$t^e = SCC = \sum_j \omega_j LCC_j \qquad t_i^{lb} = c_i^* \mathbb{P}_i - w_i \ell_i - \pi_i^f \qquad s.t. \quad \omega_i u'(c_i^*) = \bar{\lambda} \mathbb{P}_i$$

Step 2: World optimal Ramsey policy

- Maximizing welfare of the world Social Planner:

$$\mathcal{W} = \max_{\{\mathbf{t}, \mathbf{e}, \mathbf{q}\}_i} \sum_{i \in \mathbb{I}} \omega_i u(c_i) = \sum_{\mathbb{I}} \mathcal{W}_i$$

- One single instrument: uniform carbon tax \mathbf{t}^f on energy e_i^f
 - Rebate tax lump-sum to HHs $\mathbf{t}_i^L = \mathbf{t}^e e_i^f + \mathbf{t}^e e_i^c$
- Ramsey policy: Primal approach, maximize welfare subject to
- Budget constraint $[\lambda_i]$, Market clearing for good $[\mu_i]$, market clearing for energy
 - Optimality (FOC) conditions for good demands $[\eta_{ij}]$, energy demand $[v_i]$ & supply $[\theta_i]$, etc.
 - Trade-off faced by the planner:
 - (i) Correcting climate externality, (ii) Redistributive effects,
 - (iii) Distort energy demand and supply (iv) Distort/reallocate final good demand

back

Step 2: World optimal Ramsey policy

- The planner takes into account

- (i) the **marginal value of wealth** λ_i
- (ii) the **shadow value of good i** , from market clearing, μ_i :
- (iii) the **shadow value of bilateral trade ij** , from household FOC, η_{ij} :

w/ free trade $u'(c_i) = \lambda_i$

vs. w/ Armington trade $u'(c_i) = \lambda_i \left(\sum_{j \in \mathbb{I}} a_{ij} (\tau_{ij} p_j)^{1-\theta} \left[1 + \frac{\omega_j}{\omega_i} \frac{\mu_j}{\lambda_i} - \frac{\eta_{ij}}{\theta \lambda_i} (1-s_{ij}) \right]^{1-\theta} \right)^{\frac{1}{1-\theta}}$

- Relative welfare weights, representing inequality

$$\hat{\lambda}_i = \frac{\omega_i \lambda_i}{\bar{\lambda}} = \frac{\omega_i u'(c_i)}{\frac{1}{I} \sum_{j \in \mathbb{I}} \omega_j u'(c_j)} \leq 1 \quad \Rightarrow \quad \text{ceteris paribus, poorer countries have higher } \hat{\lambda}_i$$

Step 2: Optimal policy – Social Cost of Carbon

► Key objects: Local vs. Global Social Cost of Carbon:

- Marginal cost of carbon $\psi_i^{\mathcal{E}}$ for country i
- “Local social cost of carbon” (LCC) for region i :

$$LCC_i := \frac{\partial \mathcal{W}_i / \partial \mathcal{E}}{\partial \mathcal{W}_i / \partial w_i} = \frac{\psi_i^{\mathcal{E}}}{\lambda_i} \rightarrow \frac{\Delta_i \chi}{\rho - n + (1 - \eta) \bar{g}} (T_i - T_i^*) [\gamma^y p_i y_i + \gamma^u c_i \mathbb{P}_i]$$

Step 2: Optimal policy – Social Cost of Carbon

► Key objects: Local vs. Global Social Cost of Carbon:

- Marginal cost of carbon $\psi_i^\mathcal{E}$ for country i
- “Local social cost of carbon” (LCC) for region i :

$$LCC_i := \frac{\partial \mathcal{W}_i / \partial \mathcal{E}}{\partial \mathcal{W}_i / \partial w_i} = \frac{\psi_i^\mathcal{E}}{\lambda_i} \rightarrow \frac{\Delta_i \chi}{\rho - n + (1 - \eta) \bar{g}} (T_i - T_i^*) [\gamma^y p_i y_i + \gamma^u c_i \mathbb{P}_i]$$

- Social Cost of Carbon for the planner:

$$SCC := \frac{\partial \mathcal{W} / \partial \mathcal{E}}{\partial \mathcal{W} / \partial w} = \frac{\sum_{\mathbb{I}} \omega_i \psi_i^\mathcal{E}}{\frac{1}{I} \sum_{\mathbb{I}} \omega_i \lambda_i}$$

- Social Cost of Carbon integrates these inequalities:

$$SCC = \sum_{\mathbb{I}} \hat{\lambda}_i LCC_i = \sum_{\mathbb{I}} \omega_i LCC_i + \mathbb{Cov}_i(\hat{\lambda}_i, LCC_i)$$

Step 2: Optimal policy – Other motives

► Taxing fossil energy has additional redistributive effects:

1. Through energy markets: distort supply, lowers eq. fossil price, benefit net importers
2. Distort energy demand, of countries that need more or less energy
3. Reallocate goods production, which is then supplied internationally

$$\text{Supply Redistrib}^{\circ sb} + \text{Demand Distort}^{\circ sb} - \text{Trade effect}^{sb} = \underbrace{C_{EE}^f}_{\text{agg. supply inv. elast}^y} \underbrace{\text{Cov}_i(\hat{\lambda}_i, e_i^f - e_i^x)}_{\text{energy T-o-T redistrib}^{\circ}} - \underbrace{\text{Cov}_i\left(\hat{v}_i, \frac{q^f(1-s_i^e)}{\sigma_i e_i}\right)}_{\text{demand distortion}} - q^f \underbrace{\mathbb{E}_j[\hat{\mu}_j]}_{\text{good T-o-T redistrib}^{\circ}}$$

○ Params: C_{EE}^f agg. fossil inv. elasticity, s_i^e energy cost share and σ_i energy demand elasticity

Step 2: Optimal policy – Other motives

► Taxing fossil energy has additional redistributive effects:

1. Through energy markets: distort supply, lowers eq. fossil price, benefit net importers
2. Distort energy demand, of countries that need more or less energy
3. Reallocate goods production, which is then supplied internationally

$$\text{Supply Redistrib}^{\circ sb} + \text{Demand Distort}^{\circ sb} - \text{Trade effect}^{sb} = \underbrace{C_{EE}^f}_{\text{agg. supply inv. elast}^y} \underbrace{\text{Cov}_i(\widehat{\lambda}_i, e_i^f - e_i^x)}_{\text{energy T-o-T redistrib}^{\circ}} - \underbrace{\text{Cov}_i\left(\widehat{v}_i, \frac{q^f(1-s_i^e)}{\sigma_i e_i}\right)}_{\text{demand distortion}} - q^f \underbrace{\mathbb{E}_j[\widehat{\mu}_j]}_{\text{good T-o-T redistrib}^{\circ}}$$

◦ Params: C_{EE}^f agg. fossil inv. elasticity, s_i^e energy cost share and σ_i energy demand elasticity

► Proposition 2: Optimal fossil energy tax:

$$\Rightarrow \quad \mathfrak{t}^f = \text{SCC}^{sb} + \text{Supply Redistribution}^{sb} + \text{Demand Distortion}^{sb} - \text{Trade effect}^{sb}$$

– Reexpressing demand terms:

$$\mathfrak{t}^e = \left(1 + \text{Cov}_i\left(\widehat{\lambda}_i^w, \frac{\widehat{\sigma}_i e_i}{1-s_i^e}\right)\right)^{-1} \left[\sum_{\mathbb{I}} \omega_i \text{LCC}_i + \text{Cov}_i\left(\widehat{\lambda}_i^w, \text{LCC}_i\right) + C_{EE}^f \text{Cov}_i\left(\widehat{\lambda}_i^w, e_i^f - e_i^x\right) - q^f \mathbb{E}_j[\widehat{\mu}_j] \right]$$

Step 3: Ramsey Problem with participation constraints

- ▶ Consider that countries can “exit” climate agreement.
- ▶ For a climate “club” of $\mathbb{J} \subset \mathbb{I}$ countries:
 - Countries $i \in \mathbb{J}$ are subject to a carbon tax t^f
 - Countries $i \in \mathbb{J}$ can unilaterally leave, subject to retaliation tariff $t^{b,r}$ on goods and get consumption \tilde{c}_i
 - Countries $i \notin \mathbb{J}$ trade in goods subject to tariff t^b with club members and countries outside the club. They still trade with the club members in energy at price q^f

Step 3: Ramsey Problem with participation constraints

- ▶ Consider that countries can “exit” climate agreement.
- ▶ For a climate “club” of $\mathbb{J} \subset \mathbb{I}$ countries:
 - Countries $i \in \mathbb{J}$ are subject to a carbon tax t^f
 - Countries $i \in \mathbb{J}$ can unilaterally leave, subject to retaliation tariff $t^{b,r}$ on goods and get consumption \tilde{c}_i
 - Countries $i \notin \mathbb{J}$ trade in goods subject to tariff t^b with club members and countries outside the club. They still trade with the club members in energy at price q^f
- ▶ Participation constraints:

$$u(c_i) \geq u(\tilde{c}_i) \quad [\nu_i]$$

- ▶ Welfare:

$$\mathcal{W} = \max_{\{t, e, q\}_i} \sum_{\mathbb{J}} \omega_i u(c_i) + \sum_{\mathbb{J}^c} \alpha \omega_i u(c_i)$$

Step 3: Ramsey Problem with participation constraints

► Participation constraints

$$u(c_i) \geq u(\tilde{c}_i) \quad [\nu_i]$$

► Second-Best social valuation with participation constraints

- Participation incentives change our “social welfare weights” $\widehat{\lambda}_i \propto \omega_i(1+\nu_i)u'(c_i)$

w/ Armington trade

$$(1+\nu_i)u'(c_i) = \lambda_i \left(\sum_{j \in \mathbb{I}} a_{ij}(\tau_{ij} p_j)^{1-\theta} \left[1 + \frac{\omega_j}{\omega_i} \frac{\mu_j}{\lambda_i} - \frac{\eta_{ij}}{\theta \lambda_i} (1-s_{ij}) \right]^{1-\theta} \right)^{\frac{1}{1-\theta}} = \lambda_i \mathbb{P}_i$$

$$\Rightarrow \quad \widehat{\lambda}_i = \frac{\omega_i(1+\nu_i)u'(c_i)}{\frac{1}{J} \sum_{j \in \mathbb{J}} \omega_j(1+\nu_j)u'(c_j)} \neq \widehat{\lambda}_i$$

- Similarly, the “effective Pareto weights” are $\alpha \omega_i$ for countries outside the club $i \notin \mathbb{J}$

Step 3: Participation constraints & Optimal policy

► Proposition 3.2: Second-Best taxes:

- Taxation with imperfect instruments:
 - Climate change & general equilibrium effects on fossil market affects all countries $i \in \mathbb{I}$
 - Need to adjust for the "outside" countries $i \notin \mathbb{J}$ not subject to the tax, which weight on the energy market as $\vartheta_{\mathbb{J}^c} \approx \frac{E_{\mathbb{J}^c}}{E_{\mathbb{I}}} \frac{\nu \sigma}{q^f (1-s^f)}$
with ν fossil supply elasticity, σ energy demand elasticity and s^f energy cost share.
- Optimal fossil energy tax $t^f(\mathbb{J})$:

$$\Rightarrow t^f(\mathbb{J}) = \text{SCC} + \text{Supply Redistrib}^{\text{osb}} + \text{Demand Distort}^{\text{osb}} - \text{Trade effect}^{\text{sb}}$$

$$= \frac{1}{1 - \vartheta_{\mathbb{J}^c}} \sum_{i \in \mathbb{I}} \tilde{\lambda}_i \text{LCC}_i + \frac{1}{1 - \vartheta_{\mathbb{J}^c}} C_{EE}^f \sum_{i \in \mathbb{I}} \tilde{\lambda}_i (e_i^f - e_i^x) - \sum_{i \in \mathbb{J}} \tilde{v}_i \frac{q^f (1-s_i^f)}{\sigma e_i^f}$$

- Optimal tariffs/export taxes $t_{ij}^b(\mathbb{J})$ for $j \notin \mathbb{J}$
As of now, only opaque system of equations (fixed point w/ demand/multipliers)

Step 4: Unilateral optimal policy

- Unilateral Social Planner maximizing local welfare

$$\mathcal{W}_i = \max_{\mathbf{t}_i, \mathbf{c}_i} u(\mathbf{c}_i)$$

- Instruments: local carbon taxes \mathbf{t}_i^ε on energy e_i^f, e_i^c , unrestricted bilateral tariffs \mathbf{t}_{ij}^b , and lump-sum rebate to the household.
- Maximize welfare subject to the market clearing for good j , $[\mu_j^{(i)}]$, market clearing for fossil energy $\mu^{f(i)}$ and local optimality conditions

- Unilateral tariffs:

$$\mathbf{t}_{ij}^b = \omega_j^{(i)} \frac{\mu_j^{(i)}}{\lambda_i}$$

- Terms of trade manipulation weighted by $\omega_j^{(i)}$: the more planner i internalizes the good j 's market clearing, the higher the tariffs. Small Open Econ: $\omega_j^{(i)} := 0$

Step 4: Unilateral optimal policy

► Social planner i allocation and local social cost of carbon:

- Local Cost of Carbon:

$$LCC_i = -\frac{\partial \mathcal{W}_i / \partial \mathcal{E}}{\partial \mathcal{W}_i / \partial c_i} \rightarrow \frac{\chi}{\rho - n + (1 - \eta)\bar{g}} \left(\Delta_i(T_i - T_i^*) [\gamma^y p_i y_i + \gamma^u c_i \mathbb{P}_i] + \sum_j \omega_j^{(i)} \frac{\mu_j^{(i)}}{\lambda_i} \Delta_j(T_j - T_j^*) \gamma^y p_j y_j \right)$$

- International trade makes the LCC_i correlated across regions due to goods-trade linkages (\approx spatial diffusion of climate shocks from region j)

► Optimal local carbon tax:

$$t_i^\varepsilon = -q^f \frac{\mu_i^{(i)}}{\lambda_i} + q^f \nu_i \frac{e_i^f - e_i^x}{e_i^x} + LCC_i$$

- Internalizes (i) good production distortion $\mu_i^{(i)}$, (ii) energy supply redistribution (w/ ν_i inverse supply elasticity), and (iii) Pigouvian motives LCC_i .
- The tax becomes a carbon *subsidy* if oil-gas exports are large $e_i^x > e_i^f$, and if the local cost of carbon LCC_i is small

Quantification – Firms

- Production function $y_i = \mathcal{D}_i^y(T_i) z_i F(k, \varepsilon(e^f, e^r))$

$$F_i(\varepsilon(e^f, e^c, e^r), \ell) = \left[(1 - \epsilon) \frac{1}{\sigma_y} (\bar{k}^\alpha \ell^{1-\alpha})^{\frac{\sigma_y-1}{\sigma_y}} + \epsilon \frac{1}{\sigma_y} \left(z_i^e \varepsilon_i(e^f, e^c, e^r) \right)^{\frac{\sigma_y-1}{\sigma_y}} \right]^{\frac{\sigma_y}{\sigma_y-1}}$$

$$\varepsilon_i(e^f, e^c, e^r) = \left[(\omega^f)^{\frac{1}{\sigma_e}} (e^f)^{\frac{\sigma_e-1}{\sigma_e}} + (\omega^c)^{\frac{1}{\sigma_e}} (e^c)^{\frac{\sigma_e-1}{\sigma_e}} + (\omega^r)^{\frac{1}{\sigma_e}} (e^r)^{\frac{\sigma_e-1}{\sigma_e}} \right]^{\frac{\sigma_e}{\sigma_e-1}}$$

- Calibrate TFP z_i to match $y_i = GDP_i$ per capita in 2019-23 (avg. PPP).
- Technology: $\omega^f = 56\%$, $\omega^c = 27\%$, $\omega^r = 17\%$, $\epsilon = 12\%$ for all i
- Calibrate (z_i^e) to match Energy/GDP $q^e e_i / p_i y_i$

- Damage functions in production function y :

$$\mathcal{D}_i^y(T) = e^{-\gamma_i^{\pm, y} (T - T_i^*)^2}$$

- Asymmetry in damage to match empirics with $\gamma^y = \gamma^{+, y} \mathbb{1}_{\{T > T_i^*\}} + \gamma^{-, y} \mathbb{1}_{\{T < T_i^*\}}$
- Symmetric damage: $\gamma_i^{\pm, y} = \bar{\gamma}^{\pm, y}$ & $T_i^* = \bar{\alpha} T_{it_0} + (1 - \bar{\alpha}) T^*$

Quantification – Energy markets

- ▶ Fossil production e_{it}^x and reserve \mathcal{R}_{it}
 - Cost $\mathcal{C}_i(e^x, \mathcal{R}) = \frac{\bar{\nu}_i}{1+\nu_i} \left(\frac{e^x}{\mathcal{R}}\right)^{1+\nu_i} \mathcal{R}$
 - Now: $\bar{\nu}_i$ to match extraction data e_i^x , \mathcal{R}_{it} calibrated to *proven reserves* data from BP. ν_i extraction cost curvature to match profit $\pi_i^f = \frac{\bar{\nu}_i \nu_i}{1+\nu_i} \left(\frac{e_i^x}{\mathcal{R}_i}\right)^{\nu_i} \mathcal{R}_i \mathbb{P}_i$
 - Future: Choose $(\bar{\nu}_i, \nu_i, \mathcal{R}_i)$ to match marginal cost \mathcal{C}_e & extraction data e_i^x (BP, IEA)
- ▶ Coal and Renewable: Production \bar{e}_i^r, \bar{e}_i^x and price q_i^c, q_i^r
 - Calibrate $q_i^c = z^c \mathbb{P}_i, q_i^r = z^r \mathbb{P}_i$
Choose z_i^c, z_i^r to match the energy mix (e_i^f, e_i^c, e_i^r)
- ▶ Population dynamics
 - Match UN forecast for growth rate / fertility

Cost of oil-gas extraction	Slope of extraction cost $\bar{\nu}_i$	Oil-gas extracted/produced e_i^x	SRE
Cost of oil-gas extraction	Curvature of extraction cost ν_i	Profit π_i^f / energy rent	WDI
Trade costs	Distance iceberg costs τ_{ij}	Geographical distance $\tau_{ij} = d_{ij}^\beta$	CEPII
Armington preferences	CES preferences a_{ij}	Trade flows	CEPII

Theoretical investigation: decomposing the welfare effects

► Experiment:

- Start from the equilibrium where carbon tax $t_j^\varepsilon = 0$, $t_{jk}^b = 0$, $\forall j$,
- Change in welfare: Linear approximation around that point \Rightarrow small changes in carbon tax dt_j^ε , $\forall j$ and tariffs $dt_{j,k}^b$, $\forall j, k$ for a club J_i

$$\frac{d\mathcal{U}_i}{u'(c_i)} = \eta_i^c d \ln p_i + \left[-\eta_i^c \tilde{\gamma}_i \frac{1}{\bar{\nu}} - \eta_i^c s_i^e s_i^f + \eta_i^\pi \left(1 + \frac{1}{\bar{\nu}}\right) \right] d \ln q^f - \left[\eta_i^c s_i^e (s_i^c + s_i^r) + \eta_i^\pi \frac{1}{\bar{\nu}} + 1 \right] d \ln \mathbb{P}_i$$

- GE effect on energy markets $d \ln q^f \approx \bar{\nu} d \ln E^f + \dots$, due to taxation

$$d \ln q^f = - \frac{\bar{\nu}}{1 + \bar{\gamma} + \text{Cov}_i(\tilde{\lambda}_i^f, \tilde{\gamma}_i) + \bar{\nu} \bar{\lambda}^{\sigma f}} \sum_i \tilde{\lambda}_i^f J_i dt^\varepsilon + \sum_i \beta_i d \ln p_i$$

- Climate damage $\tilde{\gamma}_i = \gamma(T_i - T_i^*) T_i s^{E/S}$
- Trade and leakage effect: GE impact of t_j^ε and t_{jk}^b on y_i and p_i

◦ Params: σ energy demand elast^y, s^e energy cost share, $\bar{\nu}$ energy supply inverse elas^y

back

Welfare decomposition

► Armington model of trade with energy:

- Linearized market clearing

$$\left(\frac{dp_i}{dp_i} + \frac{dy_i}{y_i}\right) = \sum_k t_{ik} \left[\left(\frac{p_k y_k}{v_k}\right) (d \ln p_k + d \ln y_k) + \frac{q^f e_k^x}{v_k} d \ln e_k^x - \frac{q^f e_k^f}{v_k} d \ln e_k^f + \frac{q^f (e_k^x - e_k^f)}{v_k} d \ln q^f \right. \\ \left. + \theta \sum_h (s_{kh} d \ln t_{kh} - (1 + s_{ki}) d \ln t_{ki}) + (\theta - 1) \sum_h (s_{kh} d \ln p_h - d \ln p_i) \right]$$

- Fixed point for price level $d \ln p_i$

$$\left[(\mathbf{I} - \mathbf{T} \odot \mathbf{v}^y) [\mathbf{I} - \alpha^{y,p} \odot \mathbf{I}] + \mathbf{T} (v^{e^x} \odot \frac{1}{v}) + \mathbf{T} v^{e^f} \frac{\sigma^y}{1 - s^e} - (\theta - 1) (\mathbf{TS} - \mathbf{T}') - \left((\mathbf{I} - \mathbf{T} \odot \mathbf{v}^y) \alpha^{y,z} - \frac{\sigma^y}{1 - s^e} \right) \odot \bar{\gamma} \mathbf{I} \odot \left(\frac{\lambda^x}{v} \right)' \right] d \ln \mathbf{p} = \\ \left[- (\mathbf{I} - \mathbf{T} \odot \mathbf{v}^y) \alpha^{y,qf} + \mathbf{T} (v^{e^x} \odot \frac{1}{v} + v^{e^f} \frac{\sigma^y}{1 - s^e} + v^{ne}) - \left((\mathbf{I} - \mathbf{T} \odot \mathbf{v}^y) \alpha^{y,z} - \frac{\sigma^y}{1 - s^e} \right) \bar{\gamma} \frac{1}{v} \right] d \ln q^f \\ + \left[- (\mathbf{I} - \mathbf{T} \odot \mathbf{v}^y) \alpha^{y,qf} + \mathbf{T} (v^{e^f} \odot \frac{\sigma^y}{1 - s^e}) \right] \odot \mathbf{J} d \ln \mathbf{t}^e + \theta (\mathbf{TS} \odot \mathbf{J} \odot d \ln \mathbf{t}^b - \mathbf{T} (1 + \mathbf{S}') \odot (\mathbf{J} \odot d \ln \mathbf{t}^b)')$$

Trade-off – Gains from trade

Gains from trade (ACR) vs. loss from tariffs/autarky in this model [back](#)

Climate agreement and welfare

Recover 92% of welfare gains, i.e. 6% out of 6.5% conso equivalent. [back](#)

Coalition building

- ▶ How to build sequentially the climate coalition?
 - Which countries have the most interest in joining the club?

Coalition building

► Sequence of "rounds" of the static equilibrium

- At each round (n) , countries decide to enter or not depending on the gain

$$\Delta_i \mathcal{U}_i(\mathbb{J}^{(n)}) = \mathcal{U}_i(\mathbb{J}^{(n)} \cup \{i\}, t^\varepsilon, t^b) - \mathcal{U}_i(\mathbb{J}^{(n)} \setminus \{i\}, t^\varepsilon, t^b)$$

- Construction evaluated at the optimal carbon tax $t^\varepsilon = 114\$$, and tariff $t^b = 50\%$.
- Sequential procedure – coming *for free* from our CDCP algorithm / squeezing procedure
- Idea analogous to Farrokhi, Lashkaripour (2024)

Coalition building

► Sequence of "rounds" of the static equilibrium

- At each round (n), countries decide to enter or not depending on the gain

$$\Delta_i \mathcal{U}_i(\mathbb{J}^{(n)}) = \mathcal{U}_i(\mathbb{J}^{(n)} \cup \{i\}, t^e, t^b) - \mathcal{U}_i(\mathbb{J}^{(n)} \setminus \{i\}, t^e, t^b)$$

- Construction evaluated at the optimal carbon tax $t^e = 114\$$, and tariff $t^b = 50\%$.
- Sequential procedure – coming *for free* from our CDCP algorithm / squeezing procedure
- Idea analogous to Farrokhi, Lashkaripour (2024)

► Result: sequence up to the optimal climate agreement [back](#)

- Round 1: European Union, i.e. Germany, France, Spain, Italy, Rest of EU
- Round 2: China, UK, Turkey, Rest of South and South-East Asia
- Round 3: USA, Japan, Korea, Australia, Thailand, Indonesia, Pakistan, Rest of Africa & Latin America
- Round 4: Canada, South-Africa, Mexico
- Round 5: India, Brazil, Egypt, Argentina, Rest of Middle-East

✱ Stay out of the agreement: Russia, CIS, Saudi Arabia, Iran, Nigeria

Transfers – Climate fund

- ▶ COP29 Major policy proposal:
New Collective Quantified Goal (NCQG) on Climate Finance for developing countries
- ▶ In our context: lump-sum rebate of carbon tax revenues (transfers from large to low emitters)

$$t_i^{ls} = (1-\alpha) t^\varepsilon \varepsilon_i + \alpha \frac{1}{P} \sum_j t^\varepsilon \varepsilon_j$$

- ▶ Optimal transfers: [back](#)
 - $\alpha^* = 0\%$: Not optimal for rich countries to do lump-sum transfers.
 - I compare to the \$300 bn agreed in COP29: most countries loses, biggest winners (not shown) “Rest of Africa” and “Rest of South Asia”

Carbon tariffs - EU's CBAM

- ▶ Carbon Border Adjustment Mechanism: European Union's "Carbon tariff"

- Tariff t_{ij}^b scaling w/ carbon content ξ_j^y

$$t_{ij}^b = \xi_j^y t^{b,\varepsilon} = \frac{\varepsilon_j}{y_j p_j} t^{b,\varepsilon} \quad \text{if } i \in \mathbb{J}, j \notin \mathbb{J},$$

- ▶ Objective: fight carbon/trade leakage.
But also has strategic effects
(foster participation to the club)

- ▶ Optimal Carbon tariff:

- Border price of carbon $t^{b,\varepsilon} > \$1000$
- Additional constraint $t^{\varepsilon} = t^{b,\varepsilon}$
⇒ prevents any large stable club

Taxation of fossil fuels energy inputs

- Current climate club: [back](#)
Tariffs only on final goods, not energy imports
 - Empirically relevant, c.f. Shapiro (2021): inputs are more emission-intensives but trade policy is biased against final goods output

- Alternative: tax energy import t_{ij}^{bf} of non-members

$$q_{\mathbb{J}}^f = (1 + t_{ij}^{bf}) q_{\mathbb{I} \setminus \mathbb{J}}^f$$

if non-members export fossil fuels to the club

- Optimal tariffs $t^{bf} / q_{\mathbb{J}}^f = 30\%$
 - Compares to the \$60 price-cap from EU (out of $\sim \$100$ /barrel) on Russian oil (!)

Trade retaliation

- ▶ Trade war and policy retaliation:
Suppose the regions outside the agreement impose retaliatory tariffs to club members
- ▶ Exercise: [back](#)
 - Countries outside the club $j \notin \mathbb{J}$ impose tariffs $t_{ji} = \beta t_{ij}$ on club members $i \in \mathbb{J}$

$\beta = 0.25$

$\beta = 0.5$

$\beta = 1.0$
